

# Homework 1

Questions 1 and 2 below require no submission. Question 3 should be typed up **in your new editor of choice** and [submitted via Canvas](#) as a **plain text file** (file extension .txt). No Microsoft Word!

1. Install a text editor of your choice and look up the hot keys for all of the following commands:

- save, save all open files
- open file
- undo/redo
- go to particular line of code
- highlight a word/the next word/the line
- highlight all instances of a word
- copy/cut/paste words/lines
- duplicate lines

2. Install the following software on your computer:

## If you are on a Mac

The following will walk you through the process of installing XCode tools and the [Homebrew package management system](#) on your computer and setting the default shell to **bash**.

- Find the Terminal program on your computer. When it launches, copy/paste (using hotkeys?!) the following command and press **Return**.

```
xcode-select -install
```

- Copy/paste the following command and press **Return**.

```
/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"
```

- Once the installation completes, copy/paste the following two commands, one at a time.

```
brew upgrade  
brew install bash
```

- Once the installation completes, copy/paste the following command. You may be prompted to enter a password. This command will fail if you do not have administrative rights to your computer. Contact David if this is the case.

```
echo $(brew --prefix)/bin/bash | sudo tee -a /private/etc/shells
```

- Finally, execute the following command, where you replace **your-username** with your actual user name. You may (again) be prompted for a password.

```
sudo chpass -s /usr/local/bin/bash $(whoami)
```

## If you are on a Windows machine

- Follow the [video Sohail made](#) to install Windows Subsystem for Linux.

3. Write a paragraph or two description of your workflow for the class project. Your description should include:

- a summary of what data will be used;
- what analyses will be performed on the data;

- what the output of the analysis will contain;
- software (including packages) that you need to complete your workflow.
